

# COMBINED ORAL CONTRACEPTIVES (COCs)

FLAME LECTURE: 149A

KIM/ROME 9.1.15

# Learning Objectives

- ▶ Describe the mechanism of action and effectiveness of contraceptive methods
- ▶ Counsel the patient regarding the benefits, risks, and uses for each contraceptive method
- ▶ Describe barriers to effective contraceptive use and to the reduction of unintended pregnancy
- ▶ Prerequisites:
  - ▶ NONE
- ▶ See also – for closely related topics
  - ▶ FLAMEs on Barrier methods / CHCs - Ring / CHCs – Patch / Depo-provera / Mirena / ParaGard / Nexplanon
  - ▶ FLAME 213: Menstrual Cycle
  - ▶ FLAME 149A1: Combined Oral Contraceptives: Beyond the Basics
  - ▶ FLAME 149A2: The Contraceptive Counseling Visit

# OVERVIEW

- ▶ COCs, or OCPs, are a type of Combined Hormonal Contraceptive (CHC). They are Combination pills containing both an **estrogen** and a **progestin**
  - ▶ They are NOT to be confused with the 'Mini pill' which is a Progestin-only pill (POP)
- ▶ Combined Hormonal Contraceptives include
  - ▶ combined oral contraceptives (COCs)
  - ▶ combined hormonal patch
  - ▶ combined vaginal ring

# EFFICACY

**MORE EFFECTIVE**  
Less than 1 pregnancy per 100 women in one year

6 to 12 pregnancies per 100 women in one year

**LESS EFFECTIVE**  
18 or more pregnancies per 100 women in one year

# Mechanisms of action of COCs

- ▶ Primary function: **INHIBITS OVULATION** (Estrogen-mediated)
  - ▶ Inhibits LH surge to prevent ovulation
  - ▶ Suppresses FSH to suppress ovarian folliculogenesis
  - ▶ **See FLAME 213: Menstrual cycle** for better understanding
- ▶ Secondary functions (all three are progesterone-mediated)
  - ▶ **Thins endometrial lining** to become unfavorable for implantation
  - ▶ Alterations in **cervical mucus** to become less permeable to penetration by sperm
  - ▶ Impairment of normal **tubal motility** and peristalsis

# ADVANTAGES

- ▶ Cheap and easy to obtain!
- ▶ Can be used in the treatment of menstrual cycle disorders
  - ▶ Menorrhagia, dysmenorrhea, PMS and PMDD symptoms (not first-line)
- ▶ Can be used in the treatment of hyperandrogenism
  - ▶ Decreases acne and hirsutism
- ▶ Can be used in the treatment of gynecologic disorders
  - ▶ Can decrease AUB and pain from leiomyomas and endometriosis
- ▶ Cancer risk reduction
  - ▶ Decreased risk of endometrial, ovarian, colon cancers
  - ▶ Conflicting data on similar reduction in risk in BRCA ovarian cancer

# DISADVANTAGES

- ▶ Perfect use is much harder to achieve with COCs than almost any other modality
- ▶ Notably, 25% of patients have a follicle ready to ovulate on Day 7 of their cycle, thus if a patient misses the first day of COCs after the placebo week (menses), they have a chance to get pregnant in that they now have now had 8 days without hormonal suppression of the pituitary
- ▶ COCs do not protect against STIs
- ▶ They can cause breakthrough bleeding from tissue breakdown of endometrium
  - ▶ More common in lower doses of estrogen because normally estrogen will stabilize endometrium
- ▶ Amenorrhea can occur with continuous and extended regimens, as well as standard preparations
- ▶ Some reports of decreased libido, however data is mixed
- ▶ Increased risks of HTN, VTE, and stroke (but significantly less risk than pregnancy-associated risks)
- ▶ Increased metabolic concerns
  - ▶ Estrogen: increases serum triglycerides, HDL, and lowers LDL
  - ▶ Progestin: increases LDL, lowers HDL (particularly androgenic progestins)
- ▶ Contrary to popular belief, there is NO evidence of significant weight gain with COCs!

# CONTRAINDICATIONS

- ▶ **Smoking** over the age of 35
- ▶ **Diabetes** > 20 years OR any complications (nephropathy, neuropathy, retinopathy, etc)
- ▶ **HTN**
- ▶ Hx of **VTE/Stroke**, or any known thrombogenic mutations (including SLE with APAs)
- ▶ Hx of **ischemic heart disease** or **complicated valvular heart disease** (pulmonary HTN, risk for A fib, history of subacute bacterial endocarditis) or multiple risk factors or history of peripartum cardiomyopathy.
- ▶ Hx of **migraines**: new onset with OCP, > 35 years of age, OR migraines + aura at any age
- ▶ Hx of **Breast Cancer**
- ▶ **Liver** disease: acute viral hepatitis, severe cirrhosis, Hepatocellular adenoma, or malignant hepatoma, gallbladder disease (if still has gallbladder), COC-related cholestasis
- ▶ Hx of **malabsorptive bariatric surgery** (e.g. roux-en-Y)
- ▶ **Postpartum** < 21 days (42 days if other VTE risk factors)

# QUICK START METHOD (not currently using a method)

- ▶ Unlike the IUDs, it is OK to start this method even if there is a chance of pregnancy, because it is not teratogenic. If the Upreg turns positive, then stop using and make an appointment with your OB to discuss pregnancy options.

# COUNSELING

- ▶ 50% of pregnancies in the US are unplanned, and ~50% of these are terminated
- ▶ Most women with unintended pregnancies report using some form of contraception
- ▶ Reasons for nonuse of contraception include:
  - ▶ Thinking they could not get pregnant at that time (33%)
  - ▶ Not minding if they got pregnant (30%)
  - ▶ Partner did not want to use contraception (22%)
  - ▶ Side effects (16%)
  - ▶ Access problems (10%)
- ▶ No one method is perfect, but factors to consider include efficacy, convenience, duration of action, reversibility and return to fertility, effect on uterine bleeding, cost, accessibility, and medical contraindications
- ▶ Clarify needs, concerns, expectations: preferences, childbearing plans, pattern of sexual activity, social/cultural factors, ability to use method successfully, cost, ease of repeat administration, attitudes about unintended pregnancy
- ▶ **67%** of couples using CHCs continue to use that method for one year

# FERTILITY after CHC discontinuation

- ▶ Commonly, menses will return within 30 days after stopping CHCs
- ▶ Menses and full fertility should return to normal in almost all women within 90 days
- ▶ If women do not menstruate 3 months after stopping the pill, they should undergo the same workup for amenorrhea as any woman with amenorrhea
